

Safety Switches Selection Guide

Easy to find, easy to choose:
Safety switches and sens:Control – safe control solutions

The complete product range

Safety switches

The product recommendations in this selection guide represent just a small part of our safety switch portfolio.

If you cannot locate out the correct safety switch for your application in this guide we recommend you look at our catalog or visit our homepage to see the range of safety switches:

Electro-mechanical safety switches

- Safety switches with separate actuator
- Safety locking devices
- Safety positioning switches
- Safety hinge switches

Non-contact safety switches

- Magnetic safety switches
- Transponder safety switches
- Inductive safety switches

Safety command devices

- Emergency stop pushbuttons
- Rope pull switches
- Enabling switches

sens:Control – safe control solutions

The recommended safe control solutions in this selection guide reflects just a small part of the portfolio.

For further combinations between safety switches and opto-electronic protective devices with safety relays, safety controllers and network solutions see our printed catalog or contact the SICK representative in your country.

In our catalog and on our homepage you will find our complete line of products.

Safety relays

- Safety relays,
series UE10 to UE48

Safety controllers

- Modular safety controllers
- Compact safety controllers
- Flexible safety controllers
- Safety remote controllers

Network solutions

- PROFIsafe
- AS-Interface Safety at Work
- DeviceNet Safety
- Gateways

**Industrial Safety Systems.
Made by SICK.**

safetyPLUS®

from SICK covers a broad range of competence for the safety of workers and machines.

safetyPLUS® is backed by a worldwide versatile product portfolio of devices, services and safety software.

Contents

Safety products from SICK: Easy to choose and efficient to use

This guide contains a range of safety switches and the appropriate products from sens:Control – safe control solutions.

	Page
Example applications Choose the safety switch that best meets your requirements based on application examples.	4 – 5
Characteristics “Performance Level” and “Category” On the basis of the safety-engineering characteristics “Performance Level” and “Category” the selection matrix will lead you to the correct safety relay or safety controller.	6 – 7
Practical help applying the products Mounting examples and connection diagrams are provided to make installation easier.	Mounting examples Connection diagrams
Ordering information Easy-to-use ordering tables provide product and accessory part numbers.	Safety switches Safe control solutions

Important note:

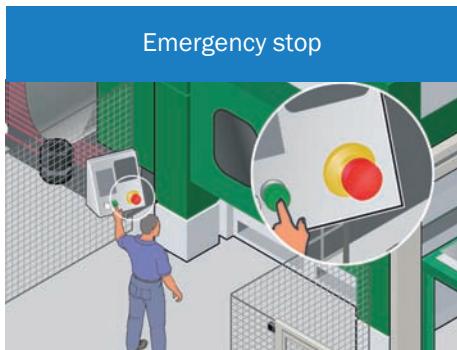

In this guide we refer to various standards. We used the latest available version of the standards that could be incorporated before printing.

Please note: if international or national standards and regulations exist, they should be given preference particularly with regard to the safety-engineering characteristics in machine oriented product standards (C standards).

SICK offers you a complete support package, which is available for the entire service life of your machine and which encompasses planning and commissioning to maintenance, repair and updating of your system. Service – configured to suit your own requirements. Please contact the SICK representative in your country.

Easy to find: The right safety switch

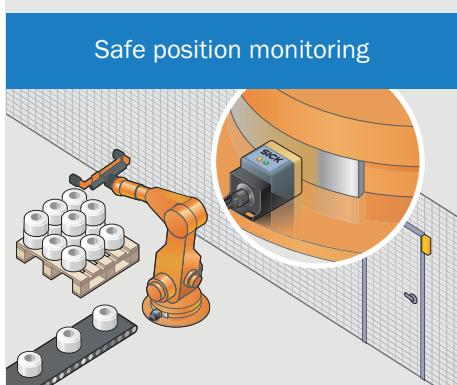

Emergency stop
pushbutton

Rope pull switch

ⓘ High distances, e.g., conveyer belts, production lines, etc.

Inductive safety
switches

Safety position
switches

ⓘ Easy to mount. High demand for mechanical tolerance (misalignment), hygiene (food industry), wear (high number of switching actuations), etc.

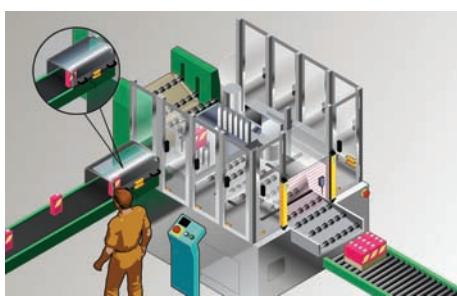

Safety locking
devices

ⓘ Protection of people (stopping/run-down), protection of processes

Safety hinge
switches

ⓘ High protection against manipulation

Non-contact safety
switches

ⓘ Easy to mount. High demand for mechanical tolerance (misalignment), hygiene (food industry), wear (high number of switching actuations), etc.

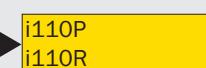

Safety switches
with separate
actuator

ⓘ Easy handling and flexible mounting

Recommended product

YES ⓘ Robust

NO ⓘ Compact

Integrated door monitoring

YES ⓘ Evaluation of door position and interlocking position

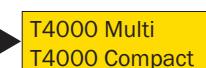

NO ⓘ Evaluation of interlocking position

Metal housing

YES ⓘ Robust

NO ⓘ Compact

High protection against manipulation

YES

Transponder safety switches

NO

Magnetic safety switches

Metal housing

YES ⓘ Robust

NO ⓘ Compact

⁴⁾ Dual-channel wiring

Depending on the application additional measures may be necessary,
e.g. second safety switch for manipulation prevention.

⁵⁾ Second safety switch for monitoring the protective device, e.g. i10R / i110R safety position switch or i10H / i110H safety hinge switch. → Mounting example page 9, no. 5

Dual-channel wiring with cross-circuit detection. → Connection diagram page 12

The safety level of the locking function is not described here!

⁶⁾ Second safety switch for monitoring the protective device,
e.g. i10R / i110R safety position switch or i10H / i110H safety hinge switch. → Mounting example page 9, no. 5

Mechanical locked

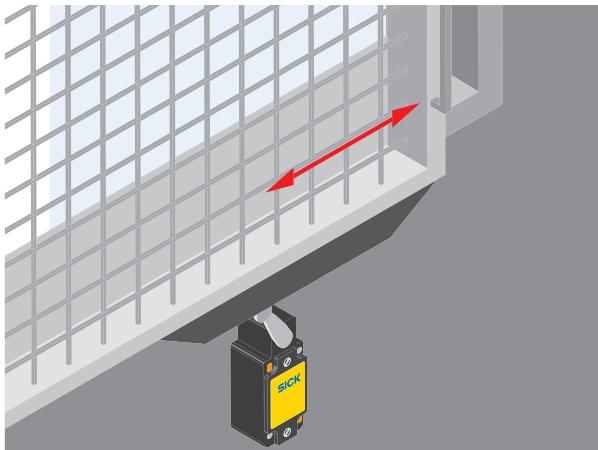

Dual-channel wiring. → Connection diagram page 13

Practical help applying the products

further information see
www.mysick.com

Mounting examples

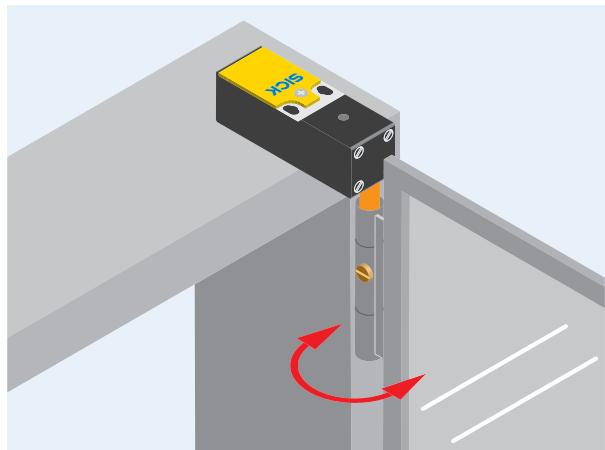

1. Safety position switch

The safety position switch has to be mounted such that the required actuator travel will be achieved safely.

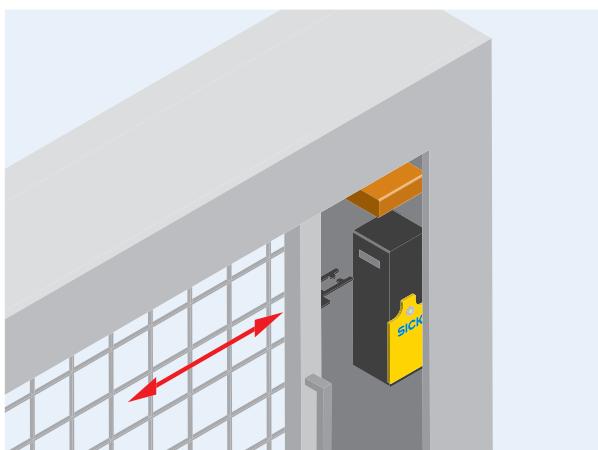

Height and angle of the cam must be tuned to the safety switch.

2. Safety hinge switch

The shaft of the safety hinge switch and the door hinge must be connected, fixed and protected against position modification.

3. Safety switch with separate actuator

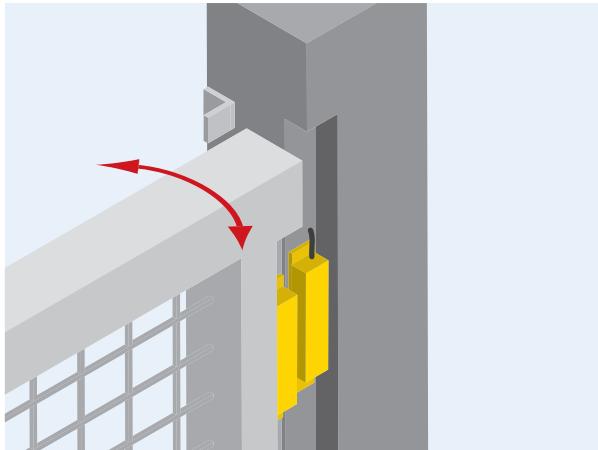

The actuator must be easily inserted into the actuating head of the safety switch. Safety switches shall not be used as a limit-stop. An additional limit-stop has to be mounted for the movable part of the guard.

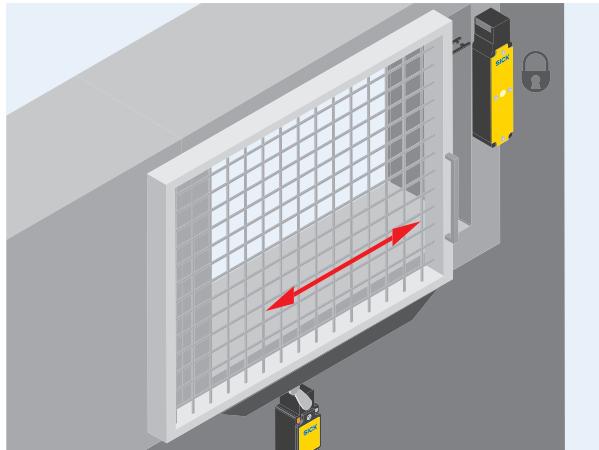

Practical help applying the products

4. Magnetic safety switch

The mounting position of magnetic safety switches is arbitrary, but it has to be assured that the alignment marking of the read head and the actuator are in one line. An additional limit-stop has to be mounted for the movable part of the guard.

5. Safety locking device and safety position switch

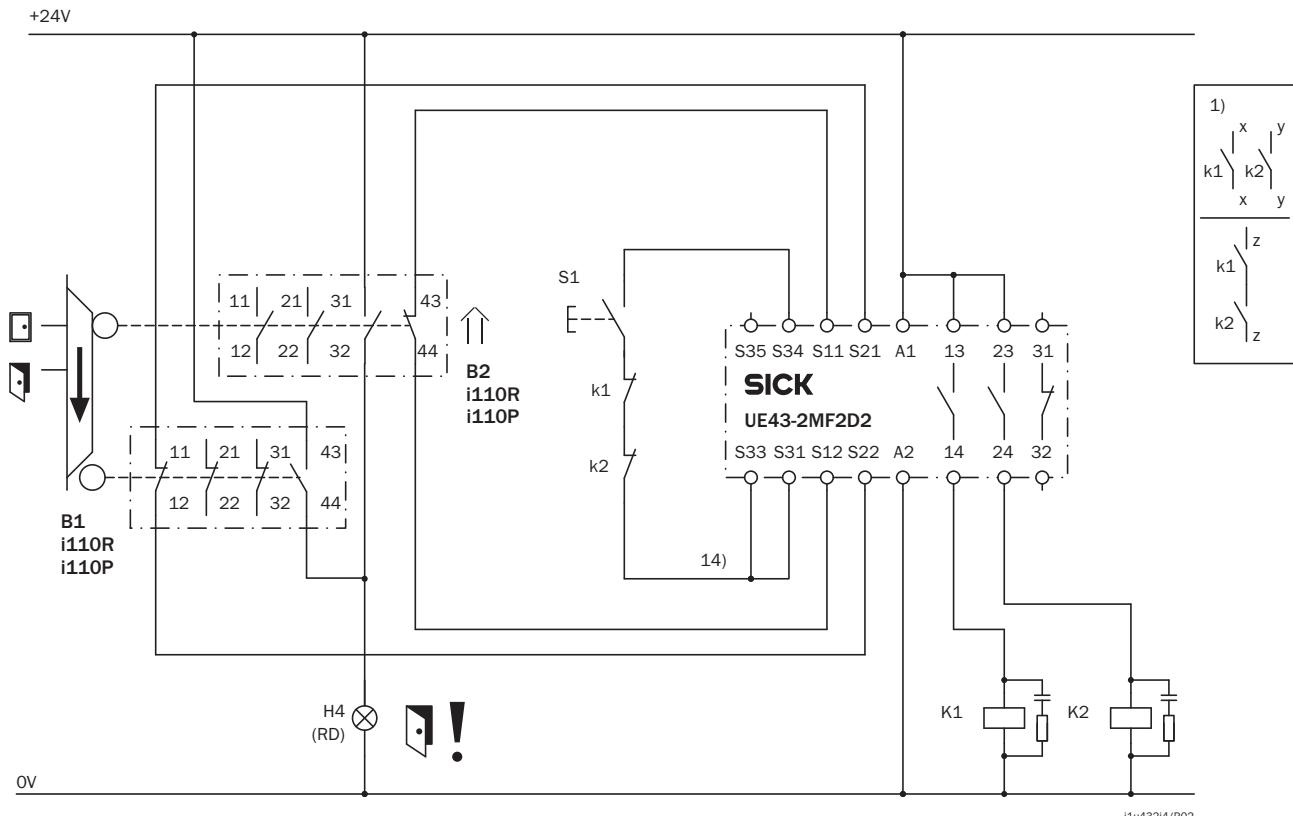

To recognize mechanical errors a redundant and divers arrangement of two safety switches is required.

Practical help applying the products

further information see
www.mysick.com

Connection diagrams

Safety door circuit with two i110R/i110P safety position switches on a UE43-2MF safety relay

Task

Safety door circuit with two i110R/i110P safety position switches on a UE43-2MF safety relay. Both safety position switches are attached to the same safety door.

Operating mode: with restart interlock and external device monitoring.

Operating characteristics

After the application of the supply voltage the system is ready for operation. If the safety door is closed and K1 and K2 are de-energised and functioning correctly, the OSSDs on the UE43-2MF are switched on by pressing and releasing the button S1. The outputs (contacts 13-14 and 23-24) energise the contactors K1 and K2. If the safety door is opened, both channels in the UE43-2MF are shutdown. The UE43-2MF de-energises the contactors K1 and K2.

Fault analysis

The erroneous behaviour of one of the contactors K1 or K2 will be detected. The shutdown function is retained. On manipulation (e.g. jamming) of the button S1 or a short-circuit in the button's circuit, the system will not re-enable the output current circuits. On the occurrence of a short-circuit on one of the contacts on one of the safety position switches, the safety function is retained. The failure will be detected the next time the safety door is actuated. On the occurrence of a cross-circuit between the safety position switches contacts, the overcurrent protection in the UE43-2MF will be triggered. On the mechanical failure of a safety position switch, the safety function is retained. The failure will be detected the next time the safety door is actuated. The H4 LED indicates that the safety door is open.

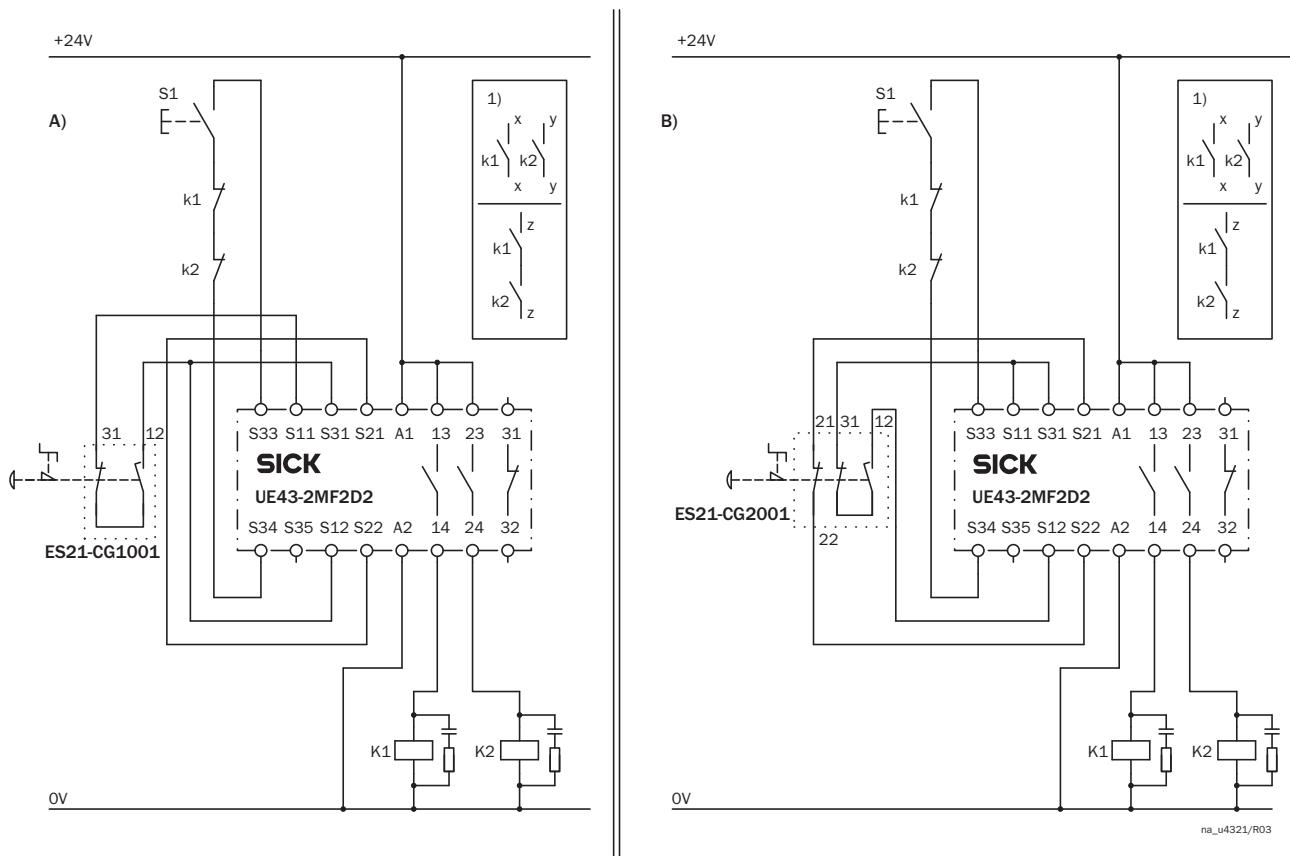

Notes

Take note of the operating instructions of the integrated devices.

Practical help applying the products

Emergency stop circuit with emergency stop pushbutton ES21 on UE43-2MF safety relay

Task

Emergency stop circuit with emergency stop pushbutton ES21 on UE43-2MF safety relay.

Operating mode: with restart interlock and external device monitoring.

A) For single-channel emergency stop pushbuttons (switching element ES21-CG1001)

B) For dual-channel emergency stop pushbuttons (switching element ES21-CG2001)

Operating characteristics

If the emergency stop pushbutton ES21 has not been actuated and K1 and K2 are de-energised and functioning correctly, the UE43-2MF is ready for switch on. The UE43-2MF is switched on by pressing and releasing the button S1. The outputs (contacts 13-14 and 23-24) energise the contactors K1 and K2. On the actuation of the emergency stop pushbutton, the UE43-2MF is shutdown and the contactors K1 and K2 are de-energised.

Fault analysis

A) Cross-circuits in the emergency stop button circuit are not detected. The erroneous behaviour of one of the contactors K1 or K2 will be detected. The shutdown function is retained. On manipulation (e.g. jamming) or a cross-circuit on the button S1, the UE43-2MF will not re-enable the output current circuits.

B) A short-circuit in an emergency stop button circuit will be detected and will trigger the inhibited state (lock-out) of the UE43-2MF. On a cross-circuit between the emergency stop button circuits, the overcurrent protection in the UE43-2MF will be triggered. The UE43-2MF shuts down. The erroneous behaviour of one of the contactors K1 or K2 will be detected. The shutdown function is retained. On manipulation (e.g. jamming) or a cross-circuit on the button S1, the UE43-2MF will not re-enable the output current circuits.

Notes

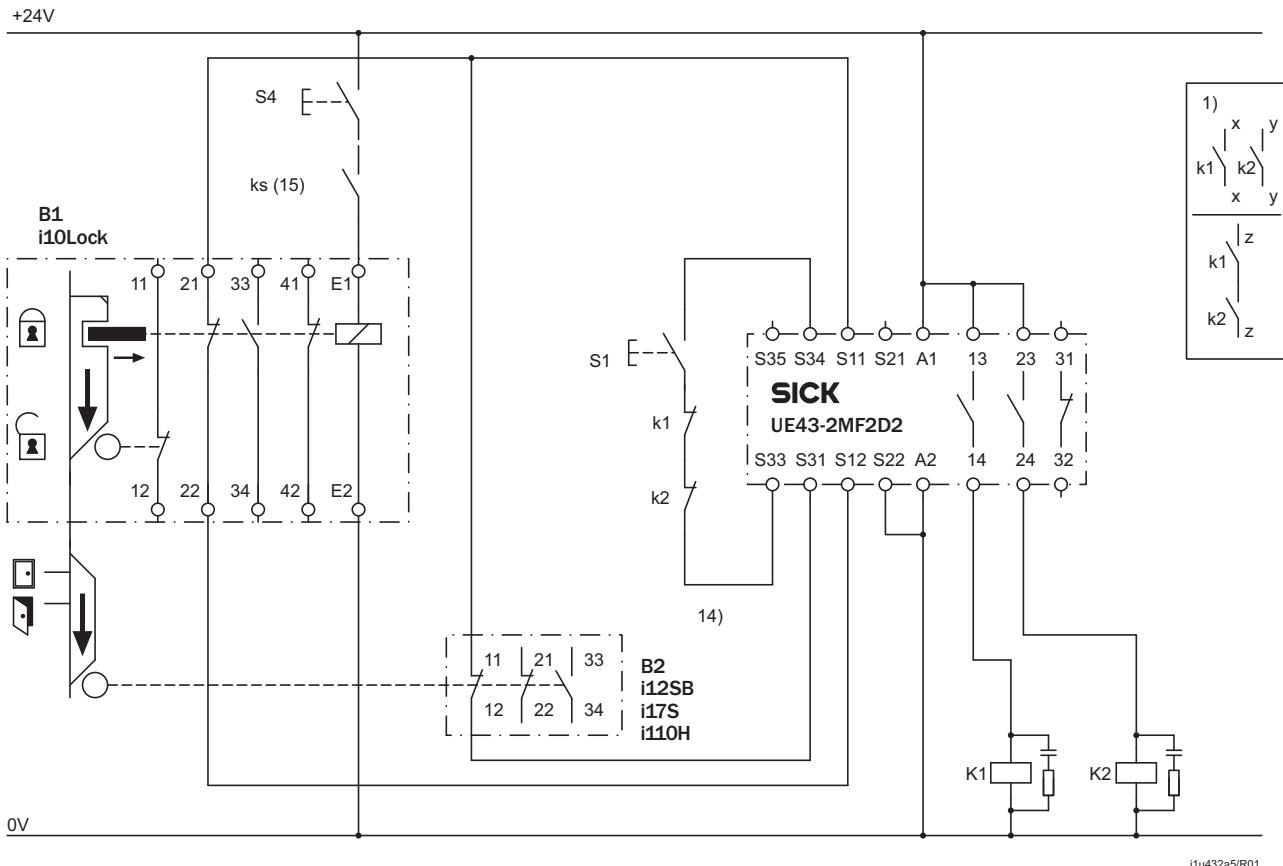

Take note of the operating instructions of the integrated devices.

Practical help applying the products

Connection diagrams

Safety door circuit with one safety switch with separate actuator and one safety locking device on UE43-2MF safety relay

i1u432a5/R01

Task

Safety door circuit with i12SB, i17S or i110H safety switch and i10 Lock safety locking device on UE43-2MF safety relay. Safety door mechanically locked and electrically unlocked. Operating mode: with restart interlock and external device monitoring.

Operating characteristics

The system is ready for operation after the application of the supply voltage. When the safety door is closed, it is mechanically locked. If the safety door is closed and K1 and K2 are de-energised and functioning correctly, the OSSDs on the UE43-2MF are switched on by pressing and releasing the button S1. The outputs (contacts 13-14 and 23-24) energise the contactors K1 and K2. If the safety door is unlocked by actuating the unlocking pushbutton S4, both channels on the UE43-2MF are shutdown. After the button S4 has been actuated, the safety door must be opened. The UE43-2MF de-energises the contactors K1 and K2. The unlocking must be interlocked with an additional enable ks (e.g. a standstill monitor).

Fault analysis

The erroneous behaviour of one of the contactors K1 or K2 will be detected. The shutdown function is retained. On manipulation (e.g. jamming) of the button S1 or a short-circuit in the button's circuit, the system will not re-enable the output current circuits. On the mechanical failure of the safety locking device or the safety switch, the safety function is retained. The failure will be detected the next time the safety door is actuated. On the occurrence of a short-circuit on one of the contacts on the safety switch or the safety locking device, the safety function is retained. The failure will be detected the next time the safety door is actuated. As cross-circuits cannot be detected, they must be prevented by the laying the wiring to the safety switch and safety locking device separately. In an emergency and in case of power failure, the safety locking device can be unlocked manually using the emergency unlocking.

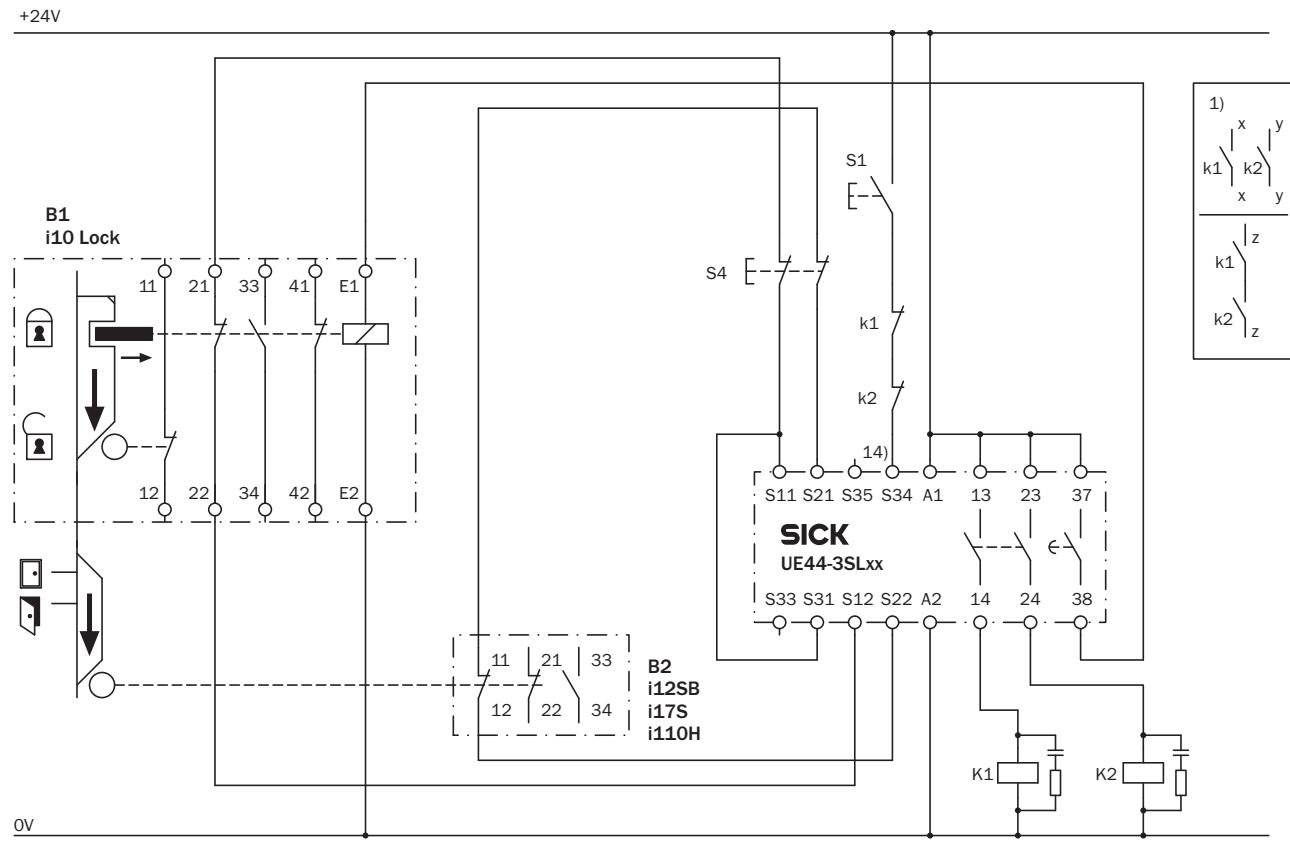

Notes

Take note of the operating instructions of the integrated devices.

Practical help applying the products

Safety door circuit with one safety switch with separate actuator and one safety locking device on a UE44-3SL safety relay

i1u433a9/R01

Task

Safety door circuit with one i12SB, i17S or i110H safety switch and one i10 Lock safety locking device on a UE44-3SL safety relay.

Safety door mechanically locked and electrically unlocked.

Operating mode: with restart interlock and contactor monitoring.

Operating characteristics

A power-up test is performed after the supply voltage is applied. After this test the system is ready for operation. The locking solenoid can now be operated using the contact 37-38 on the UE44-3SL. The safety door can now be actuated. If the safety door is closed and K1 and K2 are de-energised and functioning correctly, the contact 37-38 is opened when button S1 is pressed and released, the locking device is then activated. The outputs (contacts 13-14 and 23-24) then energise the contactors K1 and K2. To open the safety door, the button S4 must be actuated (request). As a result the UE44-3SL de-energises the contactors K1 and K2. After the time set has elapsed, the contact 37-38 is closed. The safety door can be opened.

Fault analysis

The erroneous behaviour of one of the contactors K1 or K2 will be detected. The shutdown function is retained. On manipulation (e.g. jamming) of the button S1 or a short-circuit in the button's circuit, the system will not re-enable the output current circuits. On the mechanical failure of the safety locking device or the safety switch, the safety function is retained. In certain circumstances, the failure may still not have been detected the next time the safety door is actuated. On the occurrence of a short-circuit in the safety switch or in the safety locking device, the safety function is retained. In certain circumstances, the failure may still not have been detected the next time the safety door is actuated. On the occurrence of a cross-circuit between the safety switch and the safety locking device, the overcurrent protection in the UE44-3SL will be triggered. In an emergency and in case of power failure, the safety locking device can be unlocked manually using the emergency unlocking.

Notes

Take note of the operating instructions of the integrated devices.

Our Competence in the Business Segments

Factory automation

With its intelligent sensors, safety systems, and auto ident applications, SICK realises comprehensive solutions for factory automation.

Logistics automation

Sensors made by SICK form the basis for automating material flows and the optimisation of sorting and warehousing processes.

Process automation

Optimised system solutions from SICK ensure efficient acquisition of environmental and process data in many industrial processes.

- Non-contact detecting, counting, classifying, and positioning of any types of object
- Accident protection and personal safety using sensors, as well as safety software and services

- Automated identification with bar code and RFID reading devices for the purpose of sorting and target control in industrial material flow
- Detecting volume, position, and contours of objects and surroundings with laser measurement systems

- Precise measurement of gases, liquids and dust concentrations for continuous monitoring of emissions and the acquisition of process data in production processes
- Gas flow measurements with maximum accuracy thanks to compact gas metres
